

BACKUP DATA MIGRATION TO VERITAS RECOVERY VAULT

FREE
Proof of Concept

Over a decade delivering data management and migration services to commercial and government agencies. Our business can mobilize the right people, skills and technologies to help organizations improve their performance.

GEN3i Migration Services (GMS)

in conjunction with **Veritas Recovery Vault** offers a complete tape to cloud solution utilizing your current Veritas NetBackup data protection environment. This solution can liberate and migrate your tape data that resides on legacy tape formats where the backup vendor and/or the tape drive format is no longer available in your environment.

NETBACKUP DATA TO VERITAS RECOVERY VAULT SOLUTION

GMS tape libraries and a NetBackup Media Server will be added to the present NetBackup environment where the NetBackup Master Server has the tapes cataloged. Data from the legacy tapes will be restored to the new media server where it is compared against the existing deduplication database. The deduplicated data is then written to Recovery Vault and the NetBackup Master catalog is updated with the cloud location. The GMS media server will then be virtualized and placed on-prem or in the cloud for retrieval needs.

LEGACY BACKUP VENDOR TO VERITAS RECOVERY VAULT SOLUTION

The configuration is the same as NetBackup to Veritas Recovery Vault, except GMS utilizes proprietary software that can read any legacy backup vendor/version dataset on tape. This software will reside on the GMS media server and restores will reside locally on the media server. NetBackup will then backup this liberated data, deduplicate against the existing deduplication database and then write directly to Recovery Vault. The GMS media server will then be virtualized and placed on-prem or in the cloud for retrieval needs.

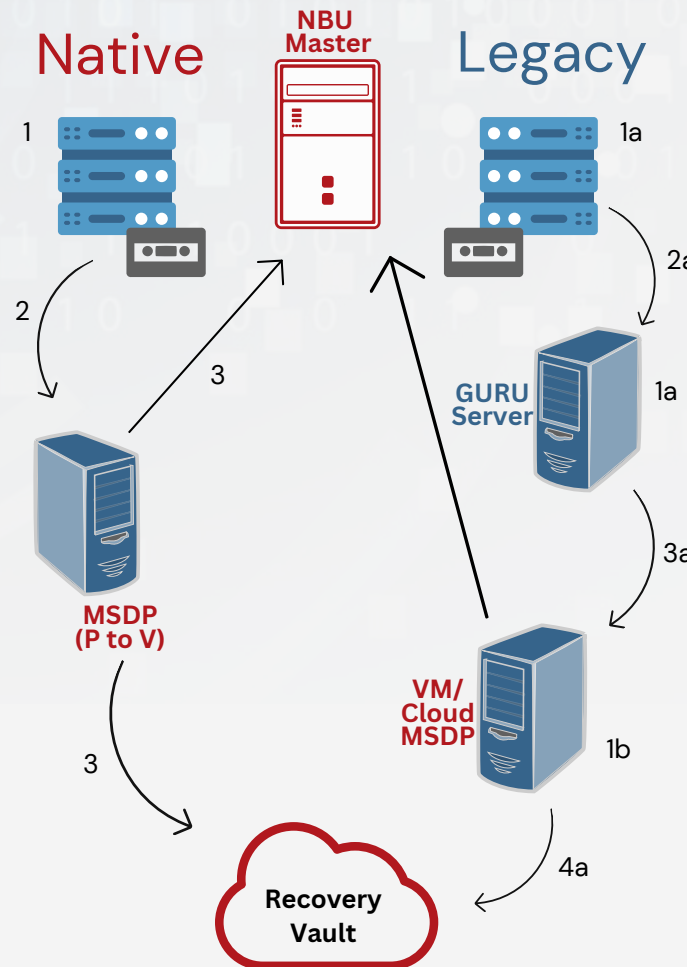

BACKUP DATA MIGRATION TO VERITAS RECOVERY VAULT

NetBackup Tape to Veritas Recovery Vault

- 1 - Utilize customer owned or GMS provided tape library
- 2 - Migration from tape to a local or GMS provided MSDP media server for deduplication
- 3 - Deduplicated data is sent off to Recovery Vault and the Master Server is updated
